## High Island Dairy Project – Part VII Attachment

### I. Offset Project Description

The High Island Project is a complete mix dairy digester system that was built to capture the biogas from dairy manure, the majority of which would have been stored in an uncovered anaerobic lagoon prior to project implementation. The biogas that is captured from the digester system is used to generate electricity through a set of 5 generators and/or sent to a boiler to provide heat. Any excess biogas not combusted by the gen-set is combusted in an enclosed flare. The effluent pond is also covered, with biogas captured and flared off intermittently. Biogas produced by the digester is monitored continuously using thermal mass flow meters.

### II. Description of type of Facility

- a. High Island Dairy has approximately 3,000 dairy cows.
  - b. In the project manure and wastewater are collected from freestall barns through a scrape system approximately 2 – 3x per day. Manure is fed to a central reception from which it is pumped directly into the digester.
  - c. This is a greenfield project.
  - d. Not applicable
  - e. As per the Livestock protocol, pre-project 90% of manure would have been stored under anaerobic conditions.
