

THOMPSON RIVER IFM ATTACHMENT K, V1.2

Below is a report of estimated live onsite carbon stock in the project area at a variety of points in time during calendar years 2011 through 2020, as used in the calculation of the High Stocking Reference. As a Registered Professional Forester licensed in the State of California, I testify that the inventory depicted over the past 10 years is reasonably accurate. It was derived following the principles set out under Option 2 in Section 4.1.1 of the “Guidance for Transitioning Early Action Projects to the California Air Resources Board’s Compliance Offset Protocol U.S. Forest Projects”, as modified to fit project-specific circumstances.

Date	Aboveground Live Carbon Stock (tCO ₂ e)
7/17/2017	1,790,355
7/21/2013	1,790,355
8/11/2011	1,815,405

While the OPO did not own the project area during the 10-year period preceding the offset project commencement date and so we lack harvest records, based on extrapolation of current trends we estimate that approximately 57,000 green tons per year have been harvested off the Project Area during the 10-year period preceding the offset project commencement date. That totals to approximately 570,000 green tons during said period.

Sincerely,

Zane Haxtema
